

GROUND SAFETY RECOMMENDATION

EMBRAER and FINGER

To dock the finger, the platform floor must be completely tilted to the left, creating the necessary space for positioning the safety shoe.

The operation is carried out by disabling the "auto" function of the cab floor from the main screen, and then pressing the lower cabin floor button (lowering the left side of the floor).

REMEMBER:

The height between the door threshold and the cabin floor must be 10-15 cm

E' It is forbidden to make any adjustment of the cab when the Passenger Boarding Bridge is moored to the aircraft.

Information:

For the full period in which the finger remains close to the aircraft, the "safety shoe" must be positioned under the base of the door.

When an anomaly occurs, it is always mandatory to report the fault and request maintenance (Control Room 63450).

Be safe at all times!
